The National Institutes of Health, the largest medical research institution in the world, has described in one volume its major scientific achievements since its establishment in 1938.

NIH: An Account of Research in Its Laboratories and Clinics, newly written by forty-eight leading investigators, includes the research approaches of a number of famous scientists and Nobel laureates, who cover basic and clinical studies in a wide variety of biomedical disciplines. Presenting frontier knowledge against a historical background, the contributions to this volume are clearly written.

A foreword by Lewis Thomas is followed by such topics as:

• neurochemistry • neurological disorders • schizophrenia • nutrition studies • tissue culture • microbiology • immunology • organic chemistry • proteins • enzymology • genetics • virus diseases • oncogenes • endocrinology • spectroscopy • heart surgery • cancer therapy.
